

Δ_∞ is not one number yet

Deepest new rungs:

χ	μ	ℓ	Δ
χ_3	22	62	16.92
χ_3	30	105	17.07
χ_3	38	129	16.82
χ_4	30	81	17.65
χ_4	38	104	18.16

χ_3 at $\ell > 60$: mean 16.94, $2\pi e - 0.14$. χ_4 : mean 17.90, $2\pi e + 0.82$. Two clusters, one nat apart. $2\pi e$ is the χ_3 attractor, not a universal Δ_∞ . A single-constant claim is false at this depth.
